FLI Software Development Library

Introduction

This library provides a core set of functions for programming FLI CCD cameras, filter wheels, and focusers under Windows and Linux. The type definitions, function prototypes, and definitions/enumerations of constant values used by library functions are spcified in <code>libfli.h</code>. All library functions return zero on successful completion, and non-zero if an error occurred. The exact nature of an error can be found by treating the negative of a function's return value as a system error code, for example:

```
if ((err = FLIOpen(&dev, name, domain)))
{
    fprintf(stderr, "Error FLIOpen: %s\n", strerror((int)-err));
    exit(1);
}
```

2

Library Defined Types

| Names | S | | |
|-------|--------------------|---------------------------------------|---|
| 2.1 | typedef long | | |
| | $flidev_t$ | An opaque handle used by library | |
| | | functions to refer to FLI hardware . | 5 |
| 2.2 | typedef long | | |
| | $flidomain_t$ | The domain of an FLI device | 6 |
| 2.3 | typedef long | | |
| | $fliframe_t$ | The frame type for an FLI CCD cam- | |
| | | era device | 6 |
| 2.4 | typedef long | | |
| | $flibitdepth_{-}t$ | The gray-scale bit depth for an FLI | |
| | | camera device | 6 |
| 2.5 | typedef long | | |
| | flishutter_t | Type used for shutter operations for | |
| | | an FLI camera device | 7 |
| 2.6 | typedef long | | |
| | flibgflush_t | Type used for background flush oper- | |
| | | ations for an FLI camera device | 7 |
| 2.7 | typedef long | | |
| | $flichannel_t$ | Type used to determine which tem- | |
| | | perature channel to read | 8 |
| 2.8 | typedef long | | |
| | $flidebug_t$ | Type specifying library debug levels. | |
| | | | 8 |

2.1 ____

typedef long flidev_t

An opaque handle used by library functions to refer to FLI hardware

An opaque handle used by library functions to refer to FLI hardware

_ 2.2

typedef long flidomain_t

The domain of an FLI device.

The domain of an FLI device. This consists of a bitwise ORed combination of interface method and device type. Valid interfaces are <code>FLIDOMAIN_PARALLEL_PORT</code>, <code>FLIDOMAIN_USB</code>, <code>FLIDOMAIN_SERIAL</code>, and <code>FLIDOMAIN_INET</code>. Valid device types are <code>FLIDEVICE_CAMERA</code>, <code>FLIDOMAIN_FILTERWHEEL</code>, and <code>FLIDOMAIN_FOCUSER</code>.

See Also:

FLIOpen FLIList

_ 2.3 _

typedef long fliframe_t

The frame type for an FLI CCD camera device.

The frame type for an FLI CCD camera device. Valid frame types are FLI_FRAME_TYPE_NORMAL and FLI_FRAME_TYPE_DARK.

See Also:

FLISetFrameType

2.4

typedef long flibitdepth_t

The gray-scale bit depth for an FLI camera device.

The gray-scale bit depth for an FLI camera device. Valid bit depths are FLI_MODE_8BIT and FLI_MODE_16BIT.

See Also:

FLISetBitDepth

2.5 _

typedef long flishutter_t

Type used for shutter operations for an FLI camera device.

Type used for shutter operations for an FLI camera device. Valid shutter types are <code>FLI_SHUTTER_CLOSE</code>, <code>FLI_SHUTTER_OPEN</code>, <code>FLI_SHUTTER_EXTERNAL_TRIGGER_HIGH</code>.

See Also:

FLIControlShutter

2.6

typedef long flibgflush_t

Type used for background flush operations for an FLI camera device.

Type used for background flush operations for an FLI camera device. Valid bgflush types are <code>FLI_BGFLUSH_STOP</code> and <code>FLI_BGFLUSH_START</code>.

See Also:

FLIControlBackgroundFlush

typedef long flichannel_t

Type used to determine which temperature channel to read.

Type used to determine which temperature channel to read. Valid channel types are FLI_TEMPERATURE_INTERNAL and FLI_TEMPERATURE_EXTERNAL.

See Also:

FLIReadTemperature

2.8 _

typedef long flidebug_t

Type specifying library debug levels.

Type specifying library debug levels. Valid debug levels are ${\tt FLIDEBUG_NONE}$, ${\tt FLIDEBUG_INFO}$, ${\tt FLIDEBUG_WARN}$, and ${\tt FLIDEBUG_FAIL}$.

See Also:

FLISetDebugLevel

3

Library Functions

| Names | | | | |
|-------|-----------|---------------------------------|---|----|
| 3.1 | LIBFLIAPI | FLICancelExposure | e (flidev_t dev) | |
| | | _ | Cancel an exposure for a given cam- | |
| | | | era | 12 |
| 3.2 | LIBFLIAPI | FLIClose (flidev_t de | | |
| | | | Close a handle to a FLI device | 13 |
| 3.3 | LIBFLIAPI | | flidev_t dev, long* ul_x, long* ul_y, long* lr_x, long* lr_y) Get the array area of the given cam- | 13 |
| | | | era | 13 |
| 3.4 | LIBFLIAPI | FLIFlushRow (flide | v_t dev, long rows, long repeat) Flush rows of a given camera | 14 |
| 3.5 | LIBFLIAPI | FLIGetFWRevision | (flidev_t dev, long* fwrev) Get firmware revision of a given device | 14 |
| 3.6 | LIBFLIAPI | FLIGetHWRevision | (flidev_t dev, long* hwrev) Get the hardware revision of a given device | 15 |
| 3.7 | LIBFLIAPI | FLIGetLibVersion (| (char* ver, size_t len) | |
| | | | Get the current library version | 15 |
| 3.8 | LIBFLIAPI | FLIGetModel (flide | v_t dev, char* model, size_t len) Get the model of a given device | 16 |
| 3.9 | LIBFLIAPI | | dev_t dev, double* pixel_x, buble* pixel_y) Find the dimensions of a pixel in the array of the given device | 16 |
| 3.10 | LIBFLIAPI | FLIGetVisibleArea | (flidev_t dev, long* ul_x, long* ul_y, long* lr_x, long* lr_y) Get the visible area of the given camera | 17 |
| 3.11 | LIBFLIAPI | FLIOpen (flidev_t* of flidomain | dev, char* name, _t domain) Get a handle to an FLI device | 18 |
| 3.12 | LIBFLIAPI | FLISetDebugLevel | (char* host, flidebug_t level) | |

| | | Enable debugging of API operations and communications. | 19 |
|------|-------------------------------------|--|----|
| 3.13 | LIBFLIAPI FLISetExposureTin | me (flidev_t dev, long exptime) Set the exposure time for a camera. | 19 |
| 3.14 | LIBFLIAPI FLISetHBin (flidev | t dev, long hbin) Set the horizontal bin factor for a given camera. | 20 |
| 3.15 | LIBFLIAPI FLISetFrameType | (flidev_t dev, fliframe_t frametype) Set the frame type for a given camera. | 20 |
| 3.16 | LIBFLIAPI FLISetImageArea | (flidev_t dev, long ul_x, long ul_y, long lr_x, long lr_y) Set the image area for a given camera. | 21 |
| 3.17 | LIBFLIAPI FLISetVBin (flidev | t dev, long vbin) Set the vertical bin factor for a given camera | 22 |
| 3.18 | LIBFLIAPI FLIGetExposureSt | atus (flidev_t dev, long* timeleft) Find the remaining exposure time of a given camera | 22 |
| 3.19 | LIBFLIAPI FLISetTemperatur | e (flidev_t dev, double temperature) Set the temperature of a given camera. | 23 |
| 3.20 | LIBFLIAPI FLIGetTemperatur | re (flidev_t dev, double* temperature) Get the temperature of a given camera. | 24 |
| 3.21 | LIBFLIAPI FLIGrabRow (flide | ev_t dev, void* buff, size_t width) Grab a row of an image | 24 |
| 3.22 | LIBFLIAPI FLIExposeFrame (| flidev_t dev) Expose a frame for a given camera. | 25 |
| 3.23 | LIBFLIAPI FLISetBitDepth (fli | idev_t dev, flibitdepth_t bitdepth) Set the gray-scale bit depth for a given camera | 25 |
| 3.24 | LIBFLIAPI FLISetNFlushes (fl | idev_t dev, long nflushes) Set the number of flushes for a given camera | 26 |
| 3.25 | LIBFLIAPI FLIReadIOPort (fl | idev_t dev, long* ioportset) Read the I/O port of a given camera. | 26 |
| 3.26 | LIBFLIAPI FLIWriteIOPort (f | | 20 |

| | | Write to the I/O port of a given camera. | 27 |
|------|--------------------------------------|---|----|
| 3.27 | LIBFLIAPI FLIConfigureIOPo | rt (flidev_t dev, long ioportset) Configure the I/O port of a given camera. | 27 |
| 3.28 | LIBFLIAPI FLILockDevice (flie | | 28 |
| 3.29 | LIBFLIAPI FLIUnlockDevice (| flidev_t dev) Unlock a specified device | 28 |
| 3.30 | LIBFLIAPI FLIControlShutter | (flidev_t dev, flishutter_t shutter) Control the shutter on a given camera | 29 |
| 3.31 | LIBFLIAPI FLIControlBackgr | oundFlush (flidev_t dev, flibgflush_t bgflush) Enables background flushing of CCD array. | 29 |
| 3.32 | LIBFLIAPI FLIList (flidomain | t domain, char*** names) List available devices | 30 |
| 3.33 | LIBFLIAPI FLIFreeList (char* | * names) Free a previously generated device list | 31 |
| 3.34 | LIBFLIAPI FLISetFilterPos (fli | dev_t dev, long filter) Set the filter wheel position of a given device | 31 |
| 3.35 | LIBFLIAPI FLIGetFilterPos (fl | idev_t dev, long* filter) Get the filter wheel position of a given device | 32 |
| 3.36 | LIBFLIAPI FLIGetStepsRemai | ining (flidev_t dev, long* steps) Get the number of motor steps remaining. | 32 |
| 3.37 | LIBFLIAPI FLIGetFilterCount | | 32 |
| 3.38 | LIBFLIAPI FLIStepMotorAsyr | | 33 |
| 3.39 | LIBFLIAPI FLIStepMotor (flid | ev_t dev, long steps) Step the filter wheel or focuser motor of a given device | 33 |
| 3.40 | LIBFLIAPI FLIGetStepperPosi | ition (flidev_t dev, long* position) | |

| | Get the stepper motor position of a given device. | 34 |
|------|--|----|
| 3.41 | LIBFLIAPI FLIHomeFocuser (flidev_t dev) *Home focuser dev | 34 |
| 3.42 | LIBFLIAPI FLIGetFocuserExtent (flidev_t dev, long* extent) *Retreive the maximum extent for FLI focuser dev | 35 |
| 3.43 | LIBFLIAPI FLIReadTemperature (flidev_t dev, flichannel_t channel, double* temperature) **Retreive temperature from the FLI focuser dev | 35 |
| 3.44 | LIBFLIAPI FLICreateList (flidomain_t domain) Creates a list of all devices within a specified domain | 36 |
| 3.45 | LIBFLIAPI FLIDeleteList (void) Deletes a list of devices created by FLICreateList() | 36 |
| 3.46 | LIBFLIAPI FLIListFirst (flidomain_t* domain, char* filename, size_t fnlen, char* name, size_t namelen) Obtains the first device in the list. | 37 |
| 3.47 | LIBFLIAPI FLIListNext (flidomain_t* domain, char* filename, size_t fnlen, char* name, size_t namelen) Obtains the next device in the list. | 37 |

_ 3.1 __

LIBFLIAPI **FLICancelExposure** (flidev_t dev)

Cancel an exposure for a given camera.

Cancel an exposure for a given camera. This function cancels an exposure in progress by closing the shutter.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to cancel the exposure of.

See Also: FLIExposeFrame

> FLIGetExposureStatus FLISetExposureTime

LIBFLIAPI **FLIClose** (flidev_t dev)

Close a handle to a FLI device

Close a handle to a FLI device

Return Value: Zero on success.

> Non-zero on failure.

Parameters: dev The device handle to be closed.

See Also: **FLIOpen**

LIBFLIAPI **FLIGetArrayArea** (flidev_t dev, long* ul_x, long* ul_y, long* lr_x, long* lr_y)

Get the array area of the given camera.

Get the array area of the given camera. This function finds the total area of the CCD array for camera dev. This area is specified in terms of a upper-left point and a lowerright point. The upper-left x-coordinate is placed in ul_x, the upper-left y-coordinate is placed in ul_y, the lower-right x-coordinate is placed in lr_x, and the lower-right y-coordinate is placed in lr_y.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to get the array area of.

ul_x Pointer to where the upper-left x-

coordinate is to beplaced.

ul_y Pointer to where the upper-left y-

coordinate is to beplaced.

lr_x Pointer to where the lower-right x-

coordinate is to beplaced.

lr_y Pointer to where the lower-right y-

coordinate is to beplaced.

See Also: FLIGetVisibleArea

FLISetImageArea

_ 3.4 __

LIBFLIAPI **FLIFlushRow** (flidev_t dev, long rows, long repeat)

Flush rows of a given camera.

Flush rows of a given camera. This function flushes rows rows of camera ${\mbox{dev}}$ repeat times.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to flush rows of.

rows Number of rows to flush.

repeat Number of times to flush each row.

See Also: FLISetNFlushes

3.5

LIBFLIAPI **FLIGetFWRevision** (flidev_t dev, long* fwrev)

Get firmware revision of a given device

Get firmware revision of a given device

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Device to find the firmware revision of.

fwrev Pointer to a long which will receive the

firmwarerevision.

See Also: FLIGetModel

FLIGetHWRevision FLIGetSerialNum

3.6

LIBFLIAPI **FLIGetHWRevision** (flidev_t dev, long* hwrev)

Get the hardware revision of a given device

Get the hardware revision of a given device

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Device to find the hardware revision of.

hwrev Pointer to a long which will receive the

hardwarerevision.

See Also: FLIGetModel

FLIGetFWRevision FLIGetSerialNum

3.7

LIBFLIAPI **FLIGetLibVersion** (char* ver, size_t len)

Get the current library version.

Get the current library version. This function copies up to len - 1 characters of the current library version string followed by a terminating NULL character into the buffer pointed to by ver.

Return Value: Zero on success. Non-zero on failure.

Parameters: ver Pointer to a character buffer where the li-

brary versionstring is to be placed.

len The size in bytes of the buffer pointed to

byver.

_ 3.8 _

LIBFLIAPI **FLIGetModel** (flidev_t dev, char* model, size_t len)

Get the model of a given device.

Get the model of a given device. This function copies up to len - 1 characters of the model string for device dev, followed by a terminating NULL character into the buffer pointed to by model.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Device to find model of.

model Pointer to a character buffer where the

model stringis to be placed.

len The size in bytes of buffer pointed to

bymodel.

See Also: FLIGetHWRevision

FLIGetFWRevision FLIGetSerialNum

3.9

LIBFLIAPI **FLIGetPixelSize** (flidev_t dev, double* pixel_x, double* pixel_y)

Find the dimensions of a pixel in the array of the given device

Find the dimensions of a pixel in the array of the given device

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Device to find the pixel size of.

pixel_x Pointer to a double which will receive the

size (inmicrons) of a pixel in the x direc-

tion.

pixel_y Pointer to a double which will receive the

size (inmicrons) of a pixel in the y direc-

tion.

See Also: FLIGetArrayArea

FLIGetVisibleArea

3.10

LIBFLIAPI **FLIGetVisibleArea** (flidev_t dev, long* ul_x, long* ul_y, long* lr_x, long* lr_y)

Get the visible area of the given camera.

Get the visible area of the given camera. This function finds the *visible* area of the CCD array for the camera dev. This area is specified in terms of a upper-left point and a lower-right point. The upper-left x-coordinate is placed in ul_x , the upper-left y-coordinate is placed in ul_y , the lower-right x-coordinate is placed in lr_x , the lower-right y-coordinate is placed in lr_y .

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to get the visible area of.

ul_x Pointer to where the upper-left x-

coordinate is to beplaced.

ul_y Pointer to where the upper-left y-

coordinate is to beplaced.

lr_x Pointer to where the lower-right x-

coordinate is to beplaced.

lr_y Pointer to where the lower-right y-

coordinate is to beplaced.

See Also: FLIGetArrayArea

FLISetImageArea

LIBFLIAPI FLIOpen (flidev_t* dev, char* name, flidomain_t domain)

Get a handle to an FLI device.

Get a handle to an FLI device. This function requires the filename and domain of the requested device. Valid device filenames can be obtained using the FLIList() function. An application may use any number of handles associated with the same physical device. When doing so, it is important to lock the appropriate device to ensure that multiple accesses to the same device do not occur during critical operations.

| Return Value: | Zero | on success. |
|---------------|----------|-------------|
| | Non-zero | on failure. |

name

Parameters: Pointer to where a device handle will be dev

placed.

Pointer to a string where the device filename to beopened is stored. For parallel port devices that are not probed byFLIList() (Windows 95/98/Me), place the address of theparallel port in a string in

ascii form ie: "0x378".

Domain to apply to name for device domain

opening. This is a bitwise ORed combination of interface method devicetype. Valid interfaces include FLIDOMAIN_PARALLEL_PORT,FLIDOMAIN_USB, FLIDOMAIN_SERIAL, and FLIDOMAIN_INET.

Valid device types

cludeFLIDEVICE_CAMERA, FLIDOMAIN_FILTERWHEEL, and FLIDOMAIN_FOCUSER.

FLIList See Also:

> **FLIClose** flidomain t

LIBFLIAPI **FLISetDebugLevel** (char* host, flidebug_t level)

Enable debugging of API operations and communications.

Enable debugging of API operations and communications. Use this function in combination with FLIDebug to assist in diagnosing problems that may be encountered during programming.

When usings Microsoft Windows operating systems, creating an empty file C: FLIDBG.TXT will override this option. All debug output will then be directed to this file

Return Value: Zero on success.

Non-zero on failure.

Parameters: host Name of the file to send debugging in-

formation to. This parameter is ignored under Linux where syslog(3) is used to send debug messages (see syslog.conf(5) for

how toconfigure syslogd).

level Debug level. A value of FLIDEBUG_NONE

disablesdebugging. Values of FLIDEBUG_FAIL, FLIDEBUG_WARN, andFLIDEBUG_INFO enable progressively

more verbose debug messages.

3.13

LIBFLIAPI **FLISetExposureTime** (flidev_t dev, long exptime)

Set the exposure time for a camera.

Set the exposure time for a camera. This function sets the exposure time for the camera dev to exptime msec.

Return Value: Zero on success. Non-zero on failure.

Parameters: dev Camera to set the exposure time of.

exptime Exposure time in msec.

See Also: FLIExposeFrame

FLICancelExposure FLIGetExposureStatus

3.14

LIBFLIAPI FLISetHBin (flidev_t dev, long hbin)

Set the horizontal bin factor for a given camera.

Set the horizontal bin factor for a given camera. This function sets the horizontal bin factor for the camera dev to hbin. The valid range of the hbin parameter is from 1 to 16.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to set horizontal bin factor of.

hbin Horizontal bin factor.

See Also: FLISetVBin

FLISetImageArea

3.15

LIBFLIAPI **FLISetFrameType** (flidev_t dev, fliframe_t frame-type)

Set the frame type for a given camera.

Set the frame type for a given camera. This function sets the frame type for camera dev to frametype. The frametype parameter is either FLI_FRAME_TYPE_NORMAL for

a normal frame where the shutter opens or ${\tt FLI_FRAME_TYPE_DARK}$ for a dark frame where the shutter remains closed.

Return Value: Zero on success.

Non-zero on failure.

Parameters: cam Camera to set the frame type of.

frametype Frame type: FLI_FRAME_TYPE_NORMAL or

FLI_FRAME_TYPE_DARK.

See Also: fliframe_t

FLIExposeFrame

3.16

LIBFLIAPI **FLISetImageArea** (flidev_t dev, long ul_x, long ul_y, long lr_x, long lr_y)

Set the image area for a given camera.

Set the image area for a given camera. This function sets the image area for camera dev to an area specified in terms of a upper-left point and a lower-right point. The upper-left x-coordinate is ul_x, the upper-left y-coordinate is ul_y, the lower-right x-coordinate is lr_x, and the lower-right y-coordinate is lr_y. Note that the given lower-right coordinate must take into account the horizontal and vertical bin factor settings, but the upper-left coordinate is absolute. In other words, the lower-right coordinate used to set the image area is a virtual point (lr'_x, lr'_y) determined by:

$$lr_x' = ul_x + (lr_x - ul_x)/hbin$$

$$lr'_{v} = ul_{v} + (lr_{v} - ul_{v})/vbin$$

Where (lr'_x, lr'_y) is the coordinate to pass to the FLISetImageArea function, (ul_x, ul_y) and (lr_x, lr_y) are the absolute coordinates of the desired image area, *hbin* is the horizontal bin factor, and *vbin* is the vertical bin factor.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to set image area of.

ul_x Upper-left x-coordinate of image area. ul_y Upper-left y-coordinate of image area. lr_x Lower-right x-coordinate of image area (lr'_x)

fromabove).

lr_y Lower-right y-coordinate of image area (lr'_y)

fromabove).

See Also: FLIGetVisibleArea

FLIGetArrayArea

3.17

LIBFLIAPI **FLISetVBin** (flidev_t dev, long vbin)

Set the vertical bin factor for a given camera.

Set the vertical bin factor for a given camera. This function sets the vertical bin factor for the camera dev to vbin. The valid range of the vbin parameter is from 1 to 16.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to set vertical bin factor of.

vbin Vertical bin factor.

See Also: FLISetHBin

FLISetImageArea

3.18 _

LIBFLIAPI **FLIGetExposureStatus** (flidev_t dev, long* timeleft)

Find the remaining exposure time of a given camera.

Find the remaining exposure time of a given camera. This functions places the remaining exposure time (in milliseconds) in the location pointed to by timeleft.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to find the remaining exposure time

of.

timeleft Pointer to where the remaining exposure

time (in milliseonds) will be placed.

See Also: FLIExposeFrame

FLICancelExposure FLISetExposureTime

_ 3.19 _

LIBFLIAPI **FLISetTemperature** (flidev_t dev, double temperature)

Set the temperature of a given camera.

Set the temperature of a given camera. This function sets the temperature of the CCD camera dev to temperature degrees Celsius. The valid range of the temperature parameter is from -55 C to 45 C.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera device to set the temperature of.

cold finger to.

See Also: FLIGetTemperature

3.20

LIBFLIAPI **FLIGetTemperature** (flidev_t dev, double* temperature)

Get the temperature of a given camera.

Get the temperature of a given camera. This function places the temperature of the CCD camera cold finger of device dev in the location pointed to by temperature.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera device to get the temperature of.

temperature Pointer to where the temperature will be

placed.

See Also: FLISetTemperature

_ 3.21 _

LIBFLIAPI **FLIGrabRow** (flidev_t dev, void* buff, size_t width)

Grab a row of an image.

Grab a row of an image. This function grabs the next available row of the image from camera device dev. The row of width width is placed in the buffer pointed to by buff. The size of the buffer pointed to by buff must take into account the bit depth of the image, meaning the buffer size must be at least width bytes for an 8-bit image, and at least 2*width for a 16-bit image.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera whose image to grab the next avail-

able row from.

buff Pointer to where the next available row will

be placed.

width Row width in pixels.

See Also: FLIGrabFrame

3.22

LIBFLIAPI **FLIExposeFrame** (flidev_t dev)

Expose a frame for a given camera.

Expose a frame for a given camera. This function exposes a frame according to the settings (image area, exposure time, bit depth, etc.) of camera dev. The settings of dev must be valid for the camera device. They are set by calling the appropriate set library functions. This function returns after the exposure has started.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to expose the frame of.

See Also: FLISetExposureTime

FLISetFrameType
FLISetImageArea
FLISetHBin
FLISetVBin
FLISetNFlushes
FLISetBitDepth
FLIGrabFrame
FLICancelExposure
FLIGetExposureStatus

3.23 .

LIBFLIAPI **FLISetBitDepth** (flidev_t dev, flibitdepth_t bitdepth)

Set the gray-scale bit depth for a given camera.

Set the gray-scale bit depth for a given camera. This function sets the gray-scale bit depth of camera dev to bitdepth. The bitdepth parameter is either FLI_MODE_8BIT for 8-bit mode or FLI_MODE_16BIT for 16-bit mode. Many cameras do not support this mode.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to set the bit depth of.

bitdepth Gray-scale bit depth: FLI_MODE_8BIT

orFLI_MODE_16BIT.

See Also: flibitdepth_t

FLIExposeFrame

LIBFLIAPI **FLISetNFlushes** (flidev_t dev, long nflushes)

Set the number of flushes for a given camera.

Set the number of flushes for a given camera. This function sets the number of times the CCD array of camera dev is flushed by the FLIExposeFrame *before* exposing a frame to nflushes. The valid range of the nflushes parameter is from 0 to 16. Some FLI cameras support background flushing. Background flushing continuously flushes the CCD eliminating the need for pre-exposure flushing.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to set the number of flushes of.

nflushes Number of times to flush CCD array before

anexposure.

See Also: FLIFlushRow

FLIExposeFrame

FLIControlBackgroundFlush

3.25

Parameters:

LIBFLIAPI **FLIReadIOPort** (flidev_t dev, long* ioportset)

Read the I/O port of a given camera.

Read the I/O port of a given camera. This function reads the I/O port on camera dev and places the value in the location pointed to by ioportset.

Return Value: Zero on success. Non-zero on failure.

Non-zero on failure.

dev Camera to read the I/O port of.

ioportset Pointer to where the I/O port data will be

stored.

See Also: FLIWriteIOPort

FLIConfigureIOPort

LIBFLIAPI **FLIWriteIOPort** (flidev_t dev, long ioportset)

Write to the I/O port of a given camera.

Write to the I/O port of a given camera. This function writes the value ioportset to the I/O port on camera dev.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to write I/O port of.

ioportset Data to be written to the I/O port.

See Also: FLIReadIOPort

FLIConfigureIOPort

3.27

LIBFLIAPI **FLIConfigureIOPort** (flidev_t dev, long ioportset)

Configure the I/O port of a given camera.

Configure the I/O port of a given camera. This function configures the I/O port on camera dev with the value ioportset.

The I/O configuration of each pin on a given camera is determined by the value of ioportset. Setting a respective I/O bit enables the port bit for output while clearing an I/O bit enables to port bit for input. By default, all I/O ports are configured as inputs.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Camera to configure the I/O port of.

ioportset Data to configure the I/O port with.

See Also: FLIReadIOPort

FLIWriteIOPort

LIBFLIAPI **FLILockDevice** (flidev_t dev)

Lock a specified device.

Lock a specified device. This function establishes an exclusive lock (mutex) on the given device to prevent access to the device by any other function or process.

Return Value: Zero on success.

Non-zero on failure.

Parameters:devDevice to lock.See Also:FLIUnlockDevice

_ 3.29 _

LIBFLIAPI **FLIUnlockDevice** (flidev_t dev)

Unlock a specified device.

Unlock a specified device. This function releases a previously established exclusive lock (mutex) on the given device to allow access to the device by any other function or process.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Device to unlock.

See Also: FLILockDevice

3.30

LIBFLIAPI **FLIControlShutter** (flidev_t dev, flishutter_t shutter)

Control the shutter on a given camera.

Control the shutter on a given camera. This function controls the shutter function on camera dev according to the shutter parameter.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Device to control the shutter of.

shutter How to control the shutter. A value

ofFLI_SHUTTER_CLOSE closes the shutter andFLI_SHUTTER_OPEN opens the shutter.FLI_SHUTTER_EXTERNAL_TRIGGER_LOW, FLI_SHUTTER_EXTERNAL_TRIGGERcauses the exposure to beginnly when a logic LOW is detected on I/O port bit 0.FLI_SHUTTER_EXTERNAL_TRIGGER_HIGH causes the exposure to beginnly when a logic HIGH is detected on I/O port bit 0. This settingmay not be available on all

cameras.

See Also: flishutter_t

3.31

 $LIBFLIAPI\ \textbf{FLIControlBackgroundFlush}\ (flidev_t$

flibgflush_t bgflush)

dev.

Enables background flushing of CCD array.

Enables background flushing of CCD array. This function enables the background flushing of the CCD array camera dev according to the bgflush parameter. Note that this function may not succeed on all FLI products as this feature may not be available.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Device to control the background flushing

of.

bgflush Enables or disables background flush-

ing. A value ofFLI_BGFLUSH_START begins background flushing. It is important tonote that background flushing is stopped whenever FLIExposeFrame() or FLIControlShutter() are called. FLI_BGFLUSH_STOP stops allbackground

flush activity.

See Also: flibgflush_t

3.32

LIBFLIAPI **FLIList** (flidomain_t domain, char*** names)

List available devices.

List available devices. This function returns a pointer to a NULL terminated list of device names. The pointer should be freed later with <code>FLIFreeList()</code>. Each device name in the returned list includes the filename needed by <code>FLIOpen()</code>, a separating semicolon, followed by the model name or user assigned device name.

Return Value: Zero on success.

Non-zero on failure.

Parameters: domain Domain to list the devices of. This is a bit-

wiseORed combination of interface method and device type. Validinterfaces include FLIDOMAIN_PARALLEL_PORT,FLIDOMAIN_USB, FLIDOMAIN_SERIAL, andFLIDOMAIN_INET. Valid device types in-

cludeFLIDEVICE_CAMERA, FLIDOMAIN_FILTERWHEEL, andFLIDOMAIN_FOCUSER.

names Pointer to where the device name list will

be placed.

See Also: flidomain_t

FLIFreeList FLIOpen

LIBFLIAPI **FLIFreeList** (char** names)

Free a previously generated device list.

Free a previously generated device list. Use this function after ${\tt FLIList}$ () to free the list of device names.

Return Value: Zero on success.

Non-zero on failure.

Parameters: names Pointer to the list.

See Also: FLIList

_ 3.34 _

LIBFLIAPI **FLISetFilterPos** (flidev_t dev, long filter)

Set the filter wheel position of a given device.

Set the filter wheel position of a given device. Use this function to set the filter wheel position of dev to filter.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Filter wheel device handle.

filter Desired filter wheel position.

See Also: FLIGetFilterPos

_ 3.35 .

LIBFLIAPI **FLIGetFilterPos** (flidev_t dev, long* filter)

Get the filter wheel position of a given device.

Get the filter wheel position of a given device. Use this function to get the filter wheel position of dev.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Filter wheel device handle.

filter Pointer to where the filter wheel position

will beplaced.

See Also: FLISetFilterPos

_ 3.36 _

LIBFLIAPI **FLIGetStepsRemaining** (flidev_t dev, long* steps)

Get the number of motor steps remaining.

Get the number of motor steps remaining. Use this function to determine if the stepper motor of dev is still moving.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Filter wheel device handle.

filter Pointer to where the number of remaning

steps will beplaced.

See Also: FLISetFilterPos

3.37

LIBFLIAPI **FLIGetFilterCount** (flidev_t dev, long* filter)

Get the filter wheel filter count of a given device.

Get the filter wheel filter count of a given device. Use this function to get the filter count of filter wheel dev.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Filter wheel device handle.

filter Pointer to where the filter wheel filter count

willbe placed.

_ 3.38 _

LIBFLIAPI **FLIStepMotorAsync** (flidev_t dev, long steps)

Step the filter wheel or focuser motor of a given device.

Step the filter wheel or focuser motor of a given device. Use this function to move the focuser or filter wheel dev by an amount steps. This function is non-blocking.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Filter wheel or focuser device handle.

steps Number of steps to move the focuser or fil-

ter wheel.

See Also: FLIGetStepperPosition

_ 3.39 _

LIBFLIAPI **FLIStepMotor** (flidev_t dev, long steps)

Step the filter wheel or focuser motor of a given device.

Step the filter wheel or focuser motor of a given device. Use this function to move the focuser or filter wheel dev by an amount steps.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Filter wheel or focuser device handle.

steps Number of steps to move the focuser or fil-

ter wheel.

See Also: FLIGetStepperPosition

_ 3.40 _

LIBFLIAPI **FLIGetStepperPosition** (flidev_t dev, long* position)

Get the stepper motor position of a given device.

Get the stepper motor position of a given device. Use this function to read the stepper motor position of filter wheel or focuser dev.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Filter wheel or focuser device handle.

position Pointer to where the postion of the stepper

motorwill be placed.

See Also: FLIStepMotor

_ 3.41 _

LIBFLIAPI **FLIHomeFocuser** (flidev_t dev)

Home focuser dev.

Home focuser dev. The home position is closed as far as mechanically possiable.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Focuser device handle.

LIBFLIAPI **FLIGetFocuserExtent** (flidev_t dev, long* extent)

Retreive the maximum extent for FLI focuser dev

Retreive the maximum extent for FLI focuser dev

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Focuser device handle.

extent Pointer to where the maximum extent of the

focuser will be placed.

3.43

LIBFLIAPI **FLIReadTemperature** (flidev_t dev, flichannel_t

channel, double* tempera-

ture)

Retreive temperature from the FLI focuser dev.

Retreive temperature from the FLI focuser $\tt dev.$ Valid channels are FLI_TEMPERATURE_INTERNAL and FLI_TEMPERATURE_EXTERNAL.

Return Value: Zero on success.

Non-zero on failure.

Parameters: dev Focuser device handle.

channel Channel to be read.

extent Pointer to where the channel temperature

will be placed.

LIBFLIAPI FLICreateList (flidomain_t domain)

Creates a list of all devices within a specified domain.

Creates a list of all devices within a specified domain. Use FLIDeleteList() to delete the list created with this function. This function is the first called begin the iteration through the list of current FLI devices attached.

Return Value: Zero on success.

Non-zero on failure.

Parameters: domain Domain to search for devices, set to zero

to search all domains. This parameter must

contain the device type.

See Also: FLIDeleteList

FLIListFirst FLIListNext

3.45

LIBFLIAPI FLIDeleteList (void)

Deletes a list of devices created by FLICreateList ()

Deletes a list of devices created by FLICreateList()

Return Value: Zero on success.

Non-zero on failure.

See Also: FLICreateList

FLIListFirst FLIListNext

LIBFLIAPI **FLIListFirst** (flidomain_t* domain, char* filename, size_t fnlen, char* name, size_t namelen)

Obtains the first device in the list.

Obtains the first device in the list. Use this function to get the first domain, filename and name from the list of attached FLI devices created using the function FLICreateList(). Use FLIListNext() to obtain more found devices.

| Tite name and hame from the list of attached the devices created using the function | | | |
|---|----------|-------------|--|
| FLICreateList(). Use FLIListNext() to obtain more found devices. | | | |
| Return Value: | Zero | on success. | |
| | Non-zero | on failure. | |

Parameters: domain Pointer to where to domain of the device

will be placed.

filename Pointer to where the filename of the device

will be placed.

fnlen Length of the supplied buffer to hold the

filename.

name Pointer to where the name of the device will

be placed.

namelen Length of the supplied buffer to hold the

name.

See Also: FLICreateList

FLIDeleteList FLIListNext

_ 3.47 _

LIBFLIAPI **FLIListNext** (flidomain_t* domain, char* filename,

size_t fnlen, char* name, size_t namelen)

Obtains the next device in the list.

Obtains the next device in the list. Use this function to get the next domain, filename and name from the list of attached FLI devices created using the function FLICreateList().

Return Value: Zero on success.

Non-zero on failure.

Parameters: domain Pointer to where to domain of the device

will be placed.

filename Pointer to where the filename of the device

will be placed.

fnlen Length of the supplied buffer to hold the

filename.

name Pointer to where the name of the device will

be placed.

namelen Length of the supplied buffer to hold the

name.

See Also: FLICreateList
